# Agenda

- Why is application security important?
- Information risk management: definitions
- Project: Introduction of IRM in the methodology
- Result: Risk analysis during project lifecycle
- Next steps
- Conclusion / Benefits

# Why application security?

# Today's Climate & Challenge

- Rapidly changing information technologies and compressed technology life cycles
- Growing complexity of IT applications and systems and increasing connectivity between systems
- Increased regulatory requirements and raising industry security standards
- New vulnerabilities continue to be found, making the game of catch-up never-ending
- Effective application security is critical for ensuring proper business control
- Security is a transparent issue to many customers – They believe that the services are as safe as it is convenient
- **Bottom line: The best infrastructure defenses are useless if the application is not secured**

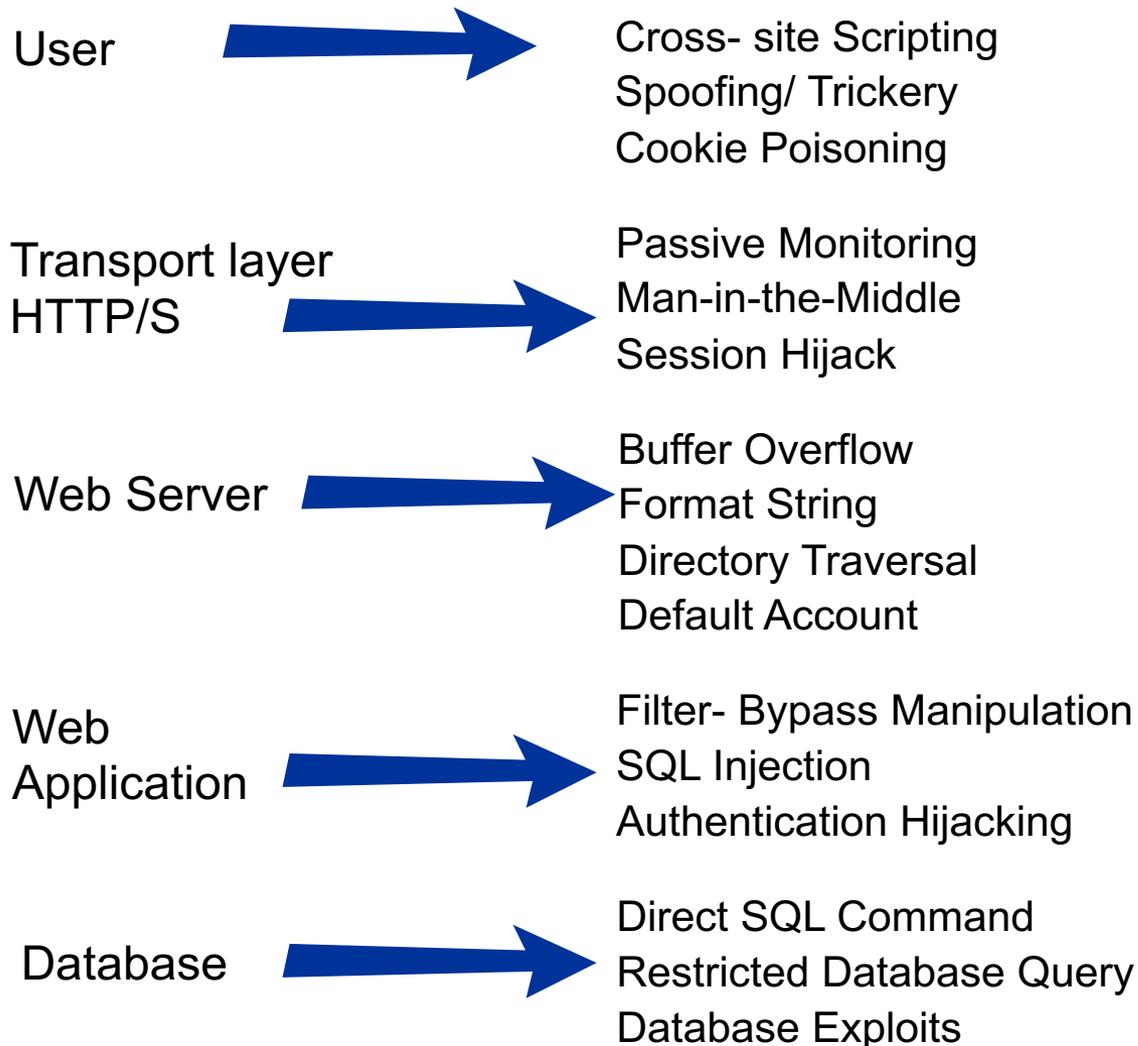

# Some Statistics

- **“Close to 75% of today's attacks are tunneling through applications.”** – Gartner Group
- **The market for Web application security products and services was worth \$140 million in 2002, and predicts it to grow at a compound annual growth rate (CAGR) of 65% to \$1.74 billion by 2007** - Yankee Group
- **3 out of 4 business websites are vulnerable to attack** – Gartner Group
- **80% of companies report outsider breaches** - IDG.net
- **The average security defect takes 75 minutes to diagnose and 6 hours to fix.** - 5-year Pentagon Study
- **Web application security will be one of the hottest segments of the security industry over the next 5 years** - Yankee Group

# The list of Application Attack Techniques Grows Every Day

## Top Application Layers & Threats

## Business Impact

- Access to unpublished pages
- Unauthorized app access
- Password theft
- Privacy and Identity theft
- Theft of customer data
- Modification of data
- Disruption of service
- Website defacement
- Recovery and cleanup
- Loss of Customer Confidence

# General Aspects When It Comes To Software Projects...

- Security is generally an afterthought
- Developers usually focus on efficient, reusable and bug-free codes rather than secure ones.
- Security is not an inherent part of the process, and is always the first one to be dropped in case of budget constrains.
- Unit Testing & QA testing usually validate only desired behavior & functionality while “neglecting” security issues.
- Development & QA staff suffers from lack of security knowledge.

# Our vision

- Our business relies on information
  - ▶ Information and information systems are vital to running our business.
  - ▶ Information needs to be up-to-date, accurate and reliable
- Need to take the right measures to ensure our information is adequately protected.
- Threats can cause serious business damage
  - ▶ Confidentiality (e.g. keeping information secret),
  - ▶ Integrity (e.g. validity, accuracy and timeliness) or
  - ▶ Availability (e.g. accessibility) of information.
- The consequences of the threats can be extremely damaging for our business.

# Information risk management - Definitions

# Information security or Risk management

# Information Risk

What is information risk?

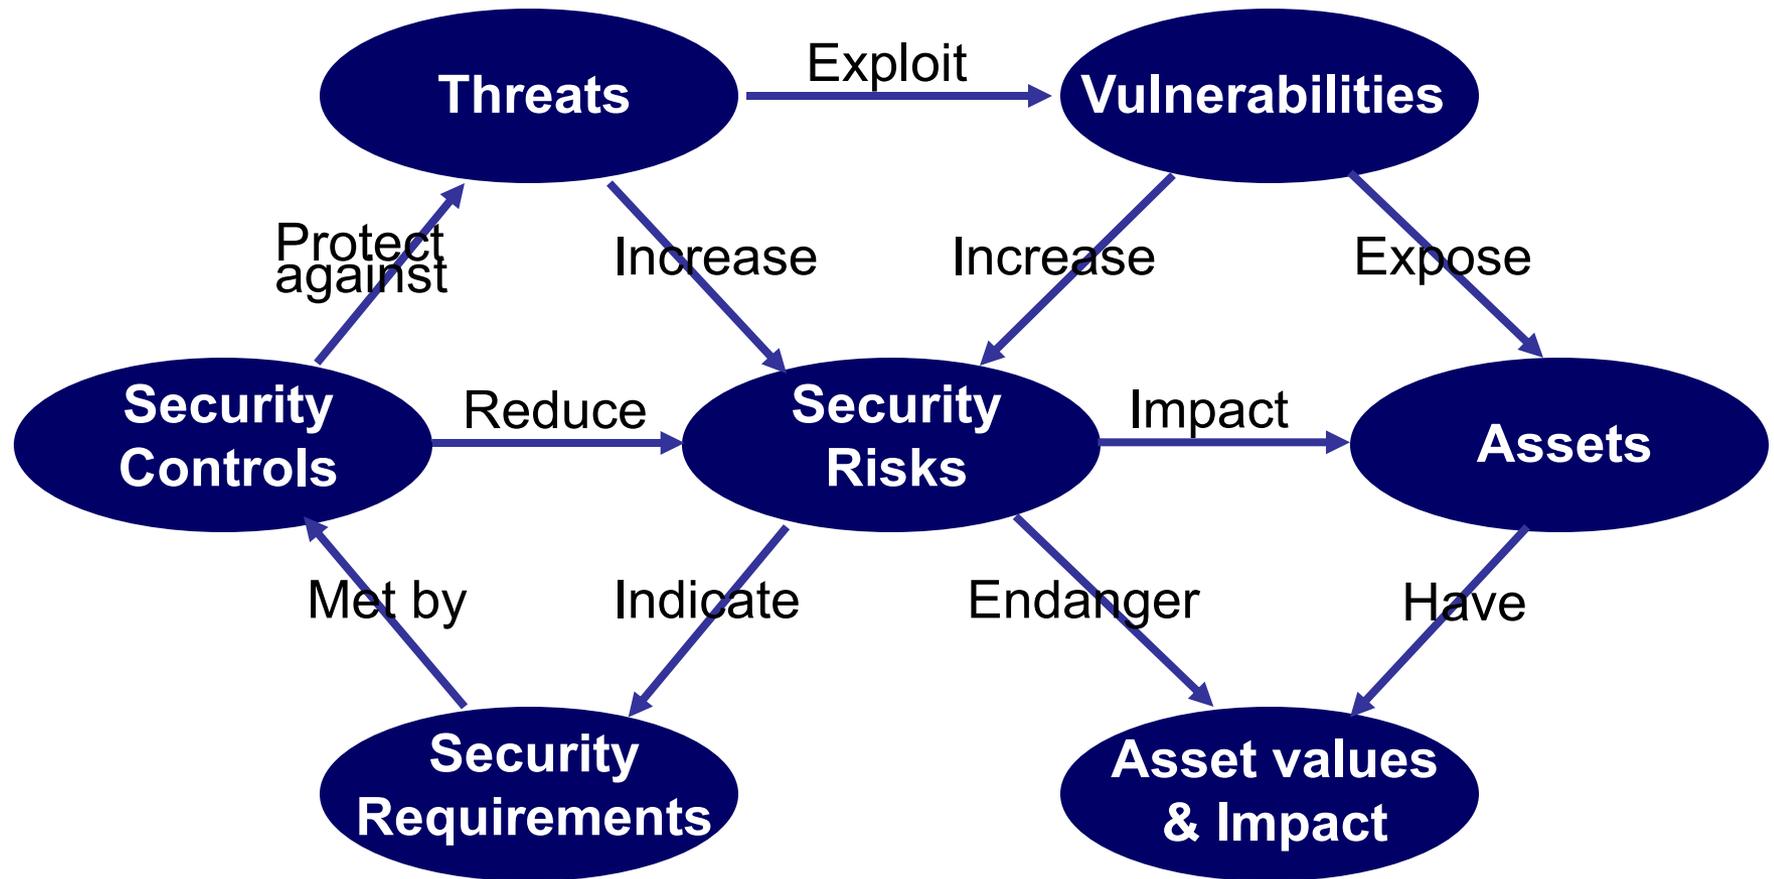

Information risk can be defined as...

## Core concepts

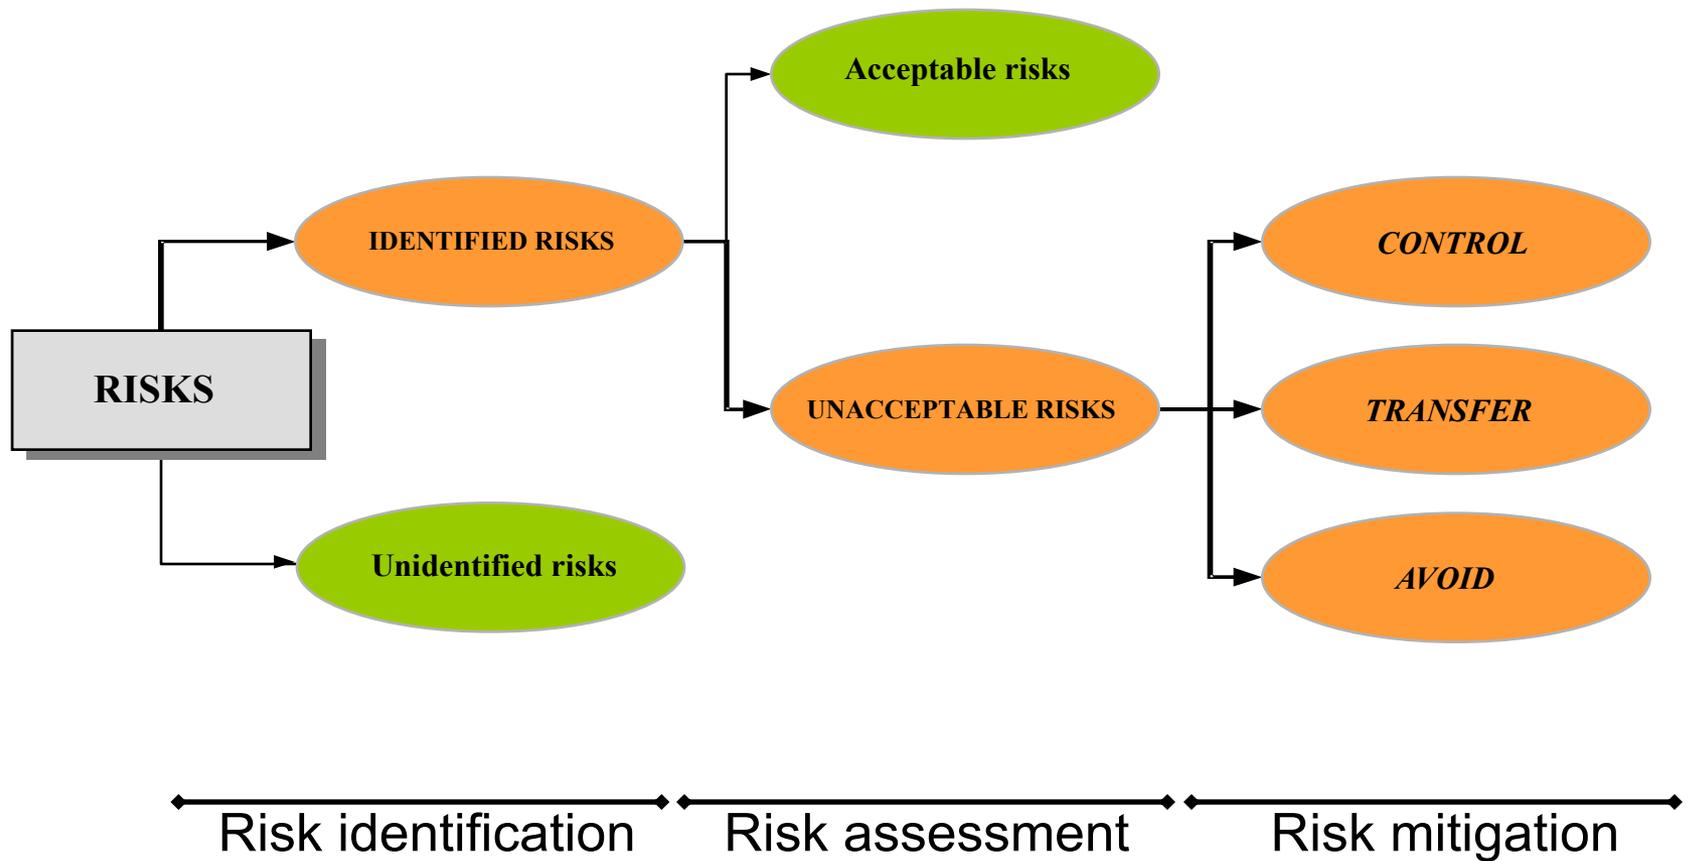

*The potential that a threat will exploit a vulnerability to cause harm to the system, to damage the value of an asset and impact the organization business*

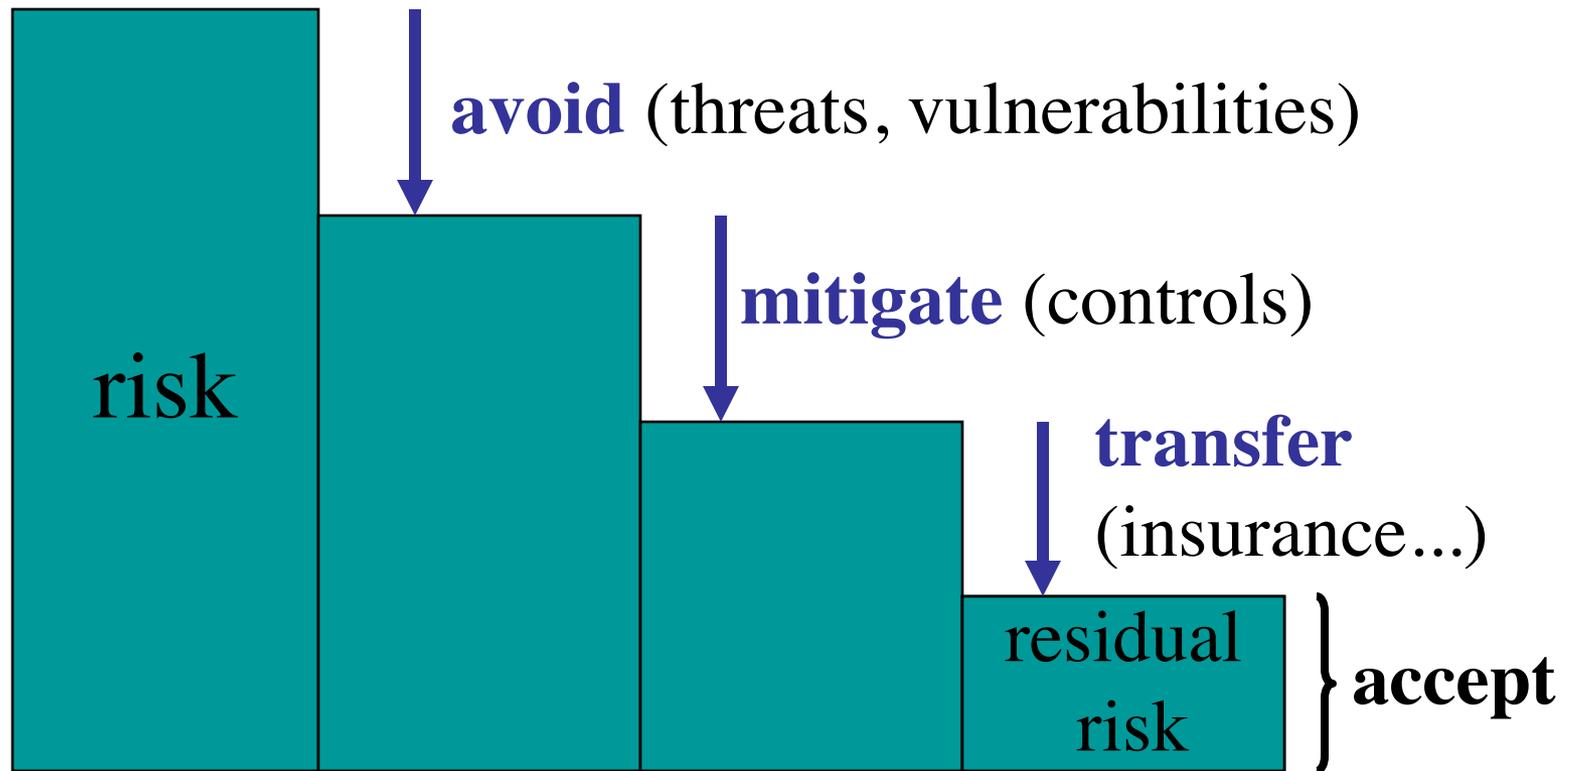

# Risk components relationships

# Risk Management

# Risk Management (cont.)

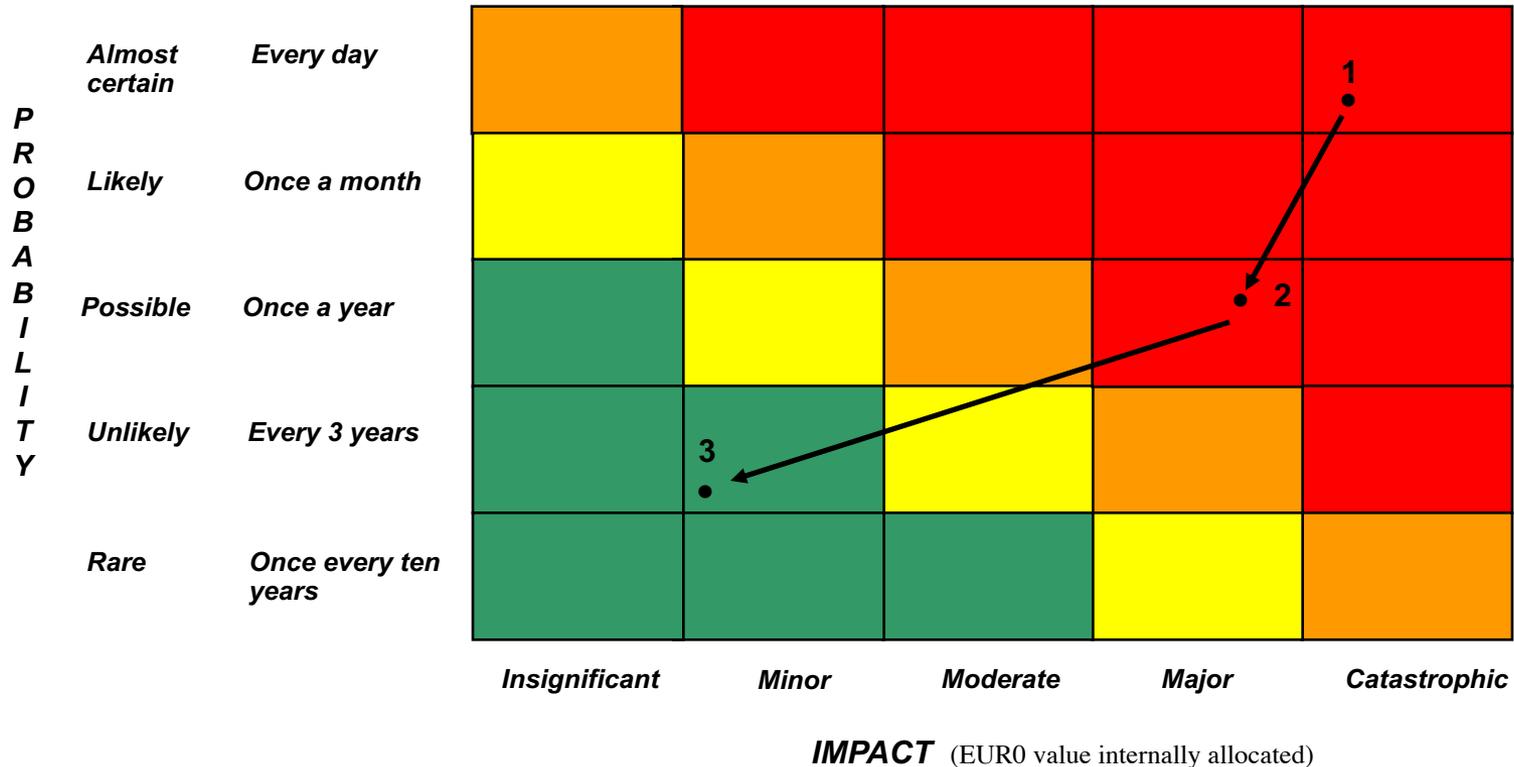

# PROCESS for Risk & Countermeasure identification

- ***Identify*** all possible risks and risk areas that are of concern and /or need attention which relate to the individual SLC process steps.
  - ▶ Validate and complete pre defined risks
  - ▶ Validation risks are correctly categorised
  
- ***Identify*** all relevant countermeasures who do exist
  - ▶ Validate and complete pre defined countermeasure list
  - ▶ Validation if countermeasures are correctly categorised
  
- ***Assess*** the level of risk of the prioritised risks as identified
  - ▶ Existing Controls identification & evaluation (adequacy)
  - ▶ Managed Risk
  
- ***Assess*** the level of risk of the residual risks as identified
  - ▶ Identification of new actions and new controlmeasures
  - ▶ Assessment of residual Risk

# PROCESS for Risk & Countermeasure identification (cont.)

## LEVEL OF RISK CONTROL MATRIX

1. Level of Absolute Risk (without controls)

2. Level of Managed Risk (with existing controls)

3. Level of Residual Risk (after implementing new controls)

# Risk Management (conclusion)

## Objectives:

- Identify and analyze the risks associated with the possession and use of information assets within the scope of the assessment
- Analyse the security requirements
- Determine appropriate means to minimize those risks
- Doesn't include remediation activities

# Introduction of Information Risk requirements in the Project life cycle

**OWASP  
AppSec  
Belgium**

**The OWASP Foundation**  
<http://www.owasp.org/>

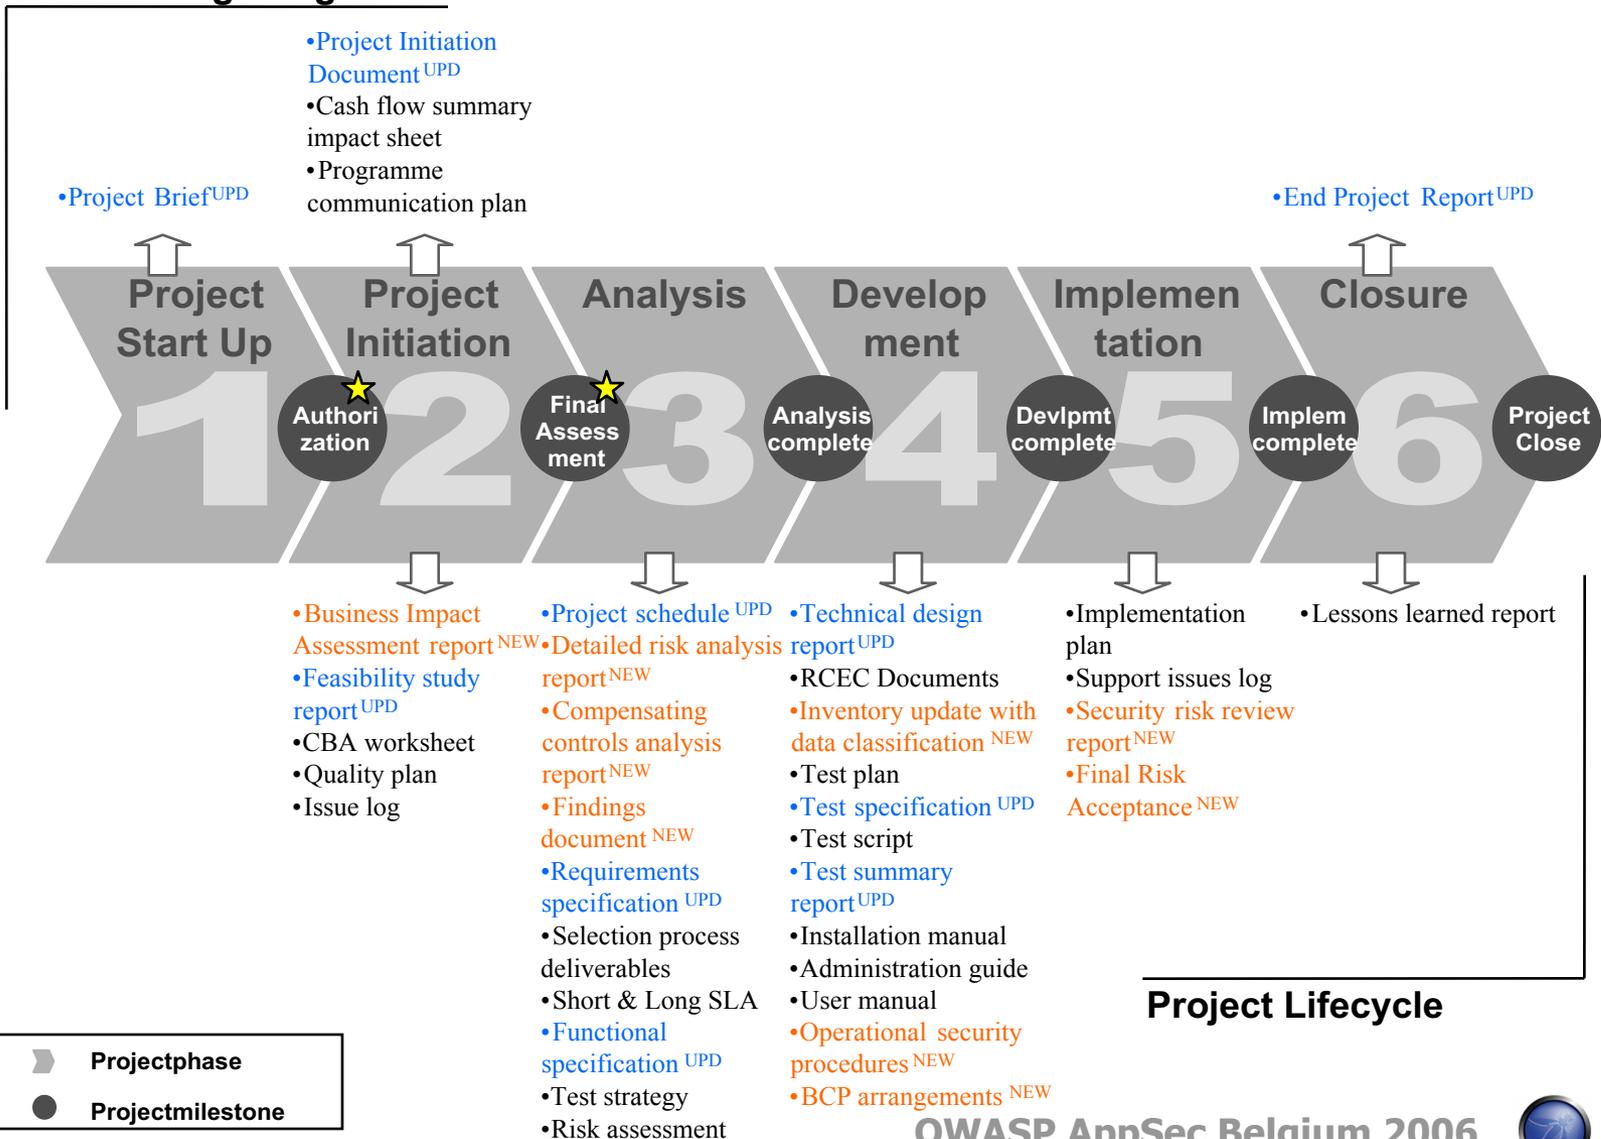

# Purpose

- Integration of the the IRM requirements into the common steps of the project lifecycle, which should enforce the overall project governance and result in risk governance.
  
- In order to...
  - Reduce life-cycle costs associated with appropriate protection of sensitive information and systems.
  - Ensure all systems provide an appropriate baseline of protection based on the Group's information security policies and standards.
  - Address application and environment-specific risks using a proactive risk management approach.
  - Harmonization of information risk management approach
  - Compliance with the Group security policies & standards
  - Adhere to ORM (Basel2) principles

# Adapted System Development Lifecycle

## Program governance

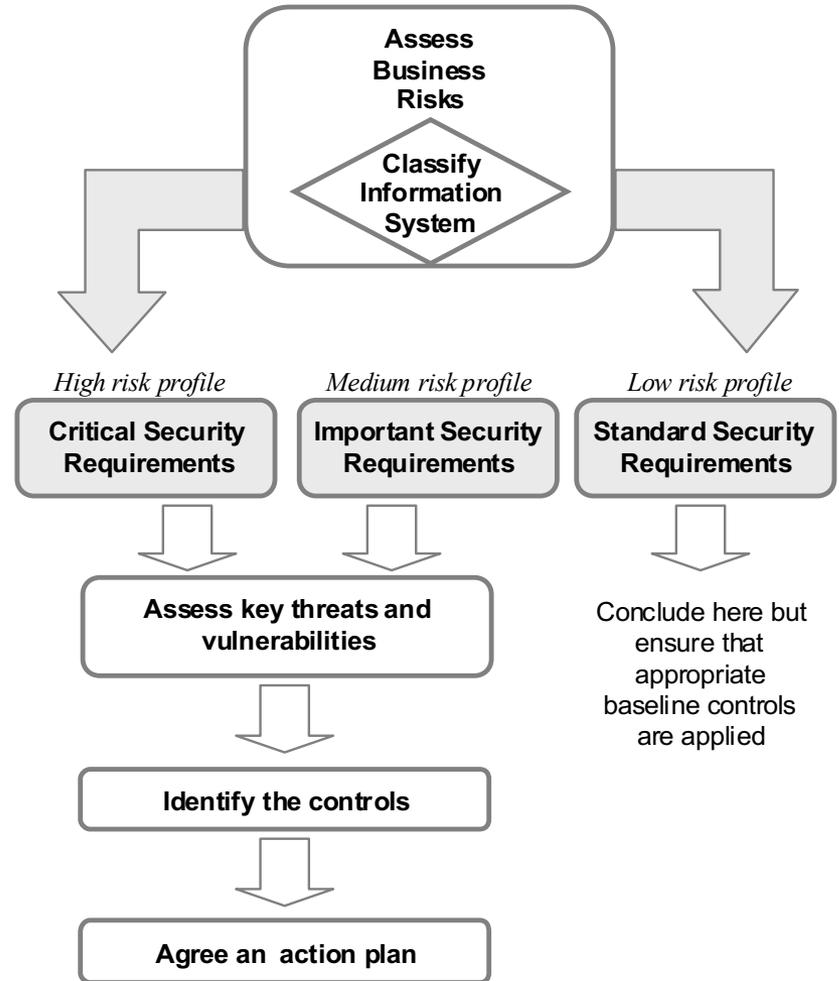

# Information Risk Management Process in Project lifecycle

- Business Impact Analysis (BIA)
- Detailed risk analysis (threats & vulnerabilities)
- Compensating controls analysis
- Global action plan
- Security review

# Guidelines

**Business  
Impact  
Assessment  
provisioned in  
each project  
brief.**

# Guidelines (cont.)

- **Clear criteria for conducting a risk assessment:**
  - **medium or high risk projects (as identified through BIA),**
  - **projects including an external connection (cf. Review Committee External Connections rests on a previously conducted risk assessment),**
  - **e-commerce applications (cf. compliance to policy),**
  - **deviations to Group Information Security policies and standards,**
  - **projects involving new technology (new systems, new products...).**
- **Qualitative and quantitative aspects in analyzing the risks for a single information system (as delivered by the project)**
- **Business activity as a whole already assessed during the BCP risk analysis**

# Guidelines (cont.):

## ■ Qualitative & quantitative measures of impact<sup>(single IS)</sup>

	<b>Qualitative measure</b>	<b>Quantitative measure: potential losses</b>
D	Insignificant/Minor	< 50.000 €
C	Moderate	50.000 <> 1 M €
B	Major	1 M € <> 10 M €
A	Catastrophic	> 10 M €

## ■ Qualitative & quantitative measures of probability<sup>(single IS)</sup>

	<b>Qualitative measure</b>	<b>Quantitative measure: potential occurrence</b>
D	Unlikely / Rare	Once every 100 years
C	Possible	Once every 10 years
B	Likely	Once every year
A	Almost certain	Every month

⇒ Approval by other bodies as and where appropriate

# Risk analysis in Project lifecycle

# Methodology: SPRINT of ISF

- Current risk analysis methodology used across the enterprise
- Simple and formal method for analyzing the business risks associated with an Information System and for agreeing what safeguards or controls are necessary

ISF : Information Security Forum

# Risk analysis in details

## Summary

- **The risk analysis is guided by a co-ordinator working in conjunction with the business manager responsible for the system under review.**
- **A typical breakdown of the effort involved in preparing for and conducting a SPRINT review is as follows:**

Phase	Co-ordination	Business manager
1- Assess business risks	½ day	1-1 ½ hours
2- Assess threats, vulnerability and controls	½ day	3-4 hours
3- Produce agreed action plan	1 day	½-1 hour

**Co-ordination= Account Manager / Project manager & IRM**  
**Account Manager/Project Manager: initiation & follow-up**  
**IRM role: support & review & approval**

## Next Step

<http://www.owasp.org/>

# Evaluation of degree of assurance

- Meetings with key stakeholders from business and application development teams
- Workshops to identify Risks, existing countermeasures, new countermeasures
- Clustering of Risks and existing/new countermeasures
- Build relationship table between countermeasures and risks
- Evaluation by stakeholders of managed risks (taking into account existing countermeasures)
- Evaluation by stakeholders of residual risks after implementation of different sets of countermeasures (3 options)
- Validation of options / proposed roadmap with key stakeholders

# Current Risk Ranking

**P  
R  
O  
B  
A  
B  
I  
L  
I  
T  
Y**

Almost certain	<b>5</b>			1, 5	2	
Likely	<b>4</b>		13, 23	6, 7, 11, 14, 26, 27	3	
Possible	<b>3</b>		12, 15, 17, 22	4, 8, 9, 10, 18, 20, 21, 24, 25		
Unlikely	<b>2</b>		16, 19			
Rare	<b>1</b>					
		<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>

Insignificant

Minor

Moderate

Major

Fundamental

**I M P A C T**

# Future of application security

- Awareness campaign to business managers and sponsors
- Closer involvement of application development teams in general security strategies
- Development of Standardised Security Review and clearly defined associated security measures
- Imposed sign-off of residual risks by business and IT under supervision of IRM
- Development of a security architecture framework
- Secure coding guidelines
- Implementation of approved DTAP (Development, Test, Acceptance, Production) environment strategy
  
- Code reviews
- Documentation standards & guidelines
- Disposal & de-commissioning specialists

## Conclusion / Benefits

**OWASP  
AppSec  
Belgium**

Sept 2006

**The OWASP Foundation**  
<http://www.owasp.org/>

# Benefits

- Common approach to risk management within project governance and the project lifecycle
- Improved security support for Project Managers
- Greater visibility of security requirements to Sponsors
- Company-wide, consistent coverage of security requirements within projects, resulting in:
  - an appropriate level of security measures and cost across the board.
  - reduced levels of vulnerabilities.
  - economic value to the company due to reduced risk exposure.
- The company will be better positioned for future audits and visits by relevant regulatory bodies.
- Security measures are no longer add-ons (i.e. in later project phases) but are fully integrated into the functional requirements and therefore part of the final product.
- Awareness by the Business of the residual risk, which has to be accepted and managed.

# Question time

**Serge Moreno**

Global Information Risk Management  
Business Application Security  
Amsterdam, Netherlands

Thank you!

# Information Risk (cont.)

## ■ Threat

**Circumstance or set of circumstances that is likely to cause an incident, and in this case a possible event that could comprise the confidentiality, integrity or availability of information associated with an IT-based information system.**

## ■ Vulnerability

**Factor which affects the probability of a threat materializing.**

# Information Risk (cont.)

## ■ Risk

**A risk is realized when a threat takes advantage of a vulnerability to cause harm to your system.**

## ■ Business impact

**Extent of disruption caused by an incident occurring and what effect the business consequence will have on organization.**

## ■ Assets

**Collective term covering information and associated IT facilities.**
