

# Scale Your Security

by Embracing Secure Defaults and Eliminating  
Bug Classes

Grayson Hardaway | [r2c.dev](https://r2c.dev)

Slides are posted at [semgrep.dev](https://semgrep.dev)

# who is

me:

Grayson Hardaway, sr. security  
engineer @ r2c  
Formerly: U.S. Department of Defense

r2c:

We're an SF based static analysis  
startup on a mission to profoundly  
improve software security and  
reliability.

# Outline

1. Why Bug-Finding Isn't The Answer
2. How to Eradicate Vulnerability Classes
3. Tools & Techniques To Make It Real

# 1. Why Bug-Finding Isn't The Answer

# **Software Development has Changed**

## **...thus Security Teams must too**

In many companies:

- Security teams can hard block engineering rarely, if ever
- Security testing must be continuous, not point in time
- Focus on building, not just breaking
- Embedded or partnered closely with dev teams

 We need to re-visit our prior assumptions

# Massive Shifts in Tech and Security

Secure defaults and  
invariants

Before

After

# Invariant

A property that must either  
always or  
never be true

No context  
needed to  
make a decision

Key  
Insight

==

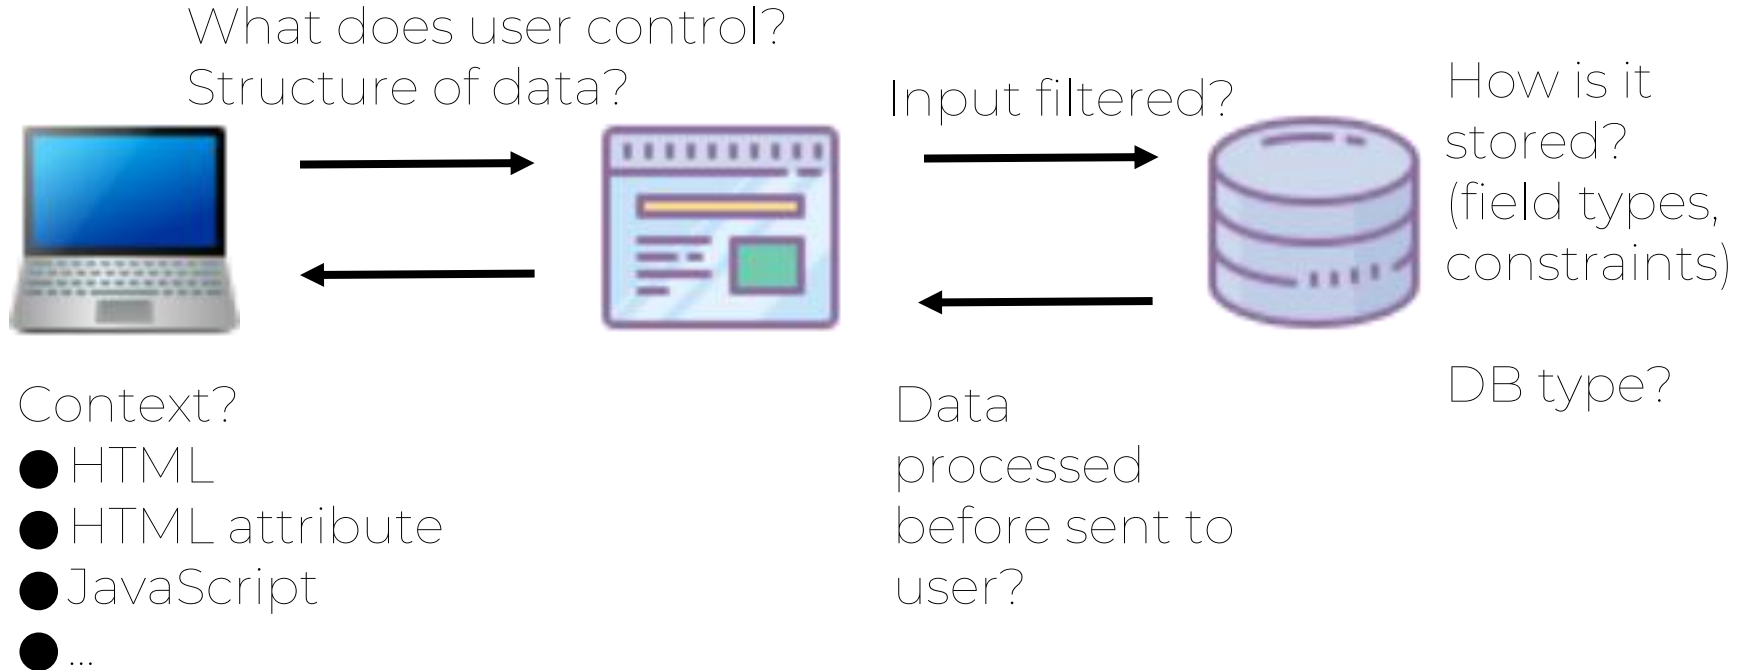

No operational time  
for the security  
team

# Quiz: Does this app have XSS?

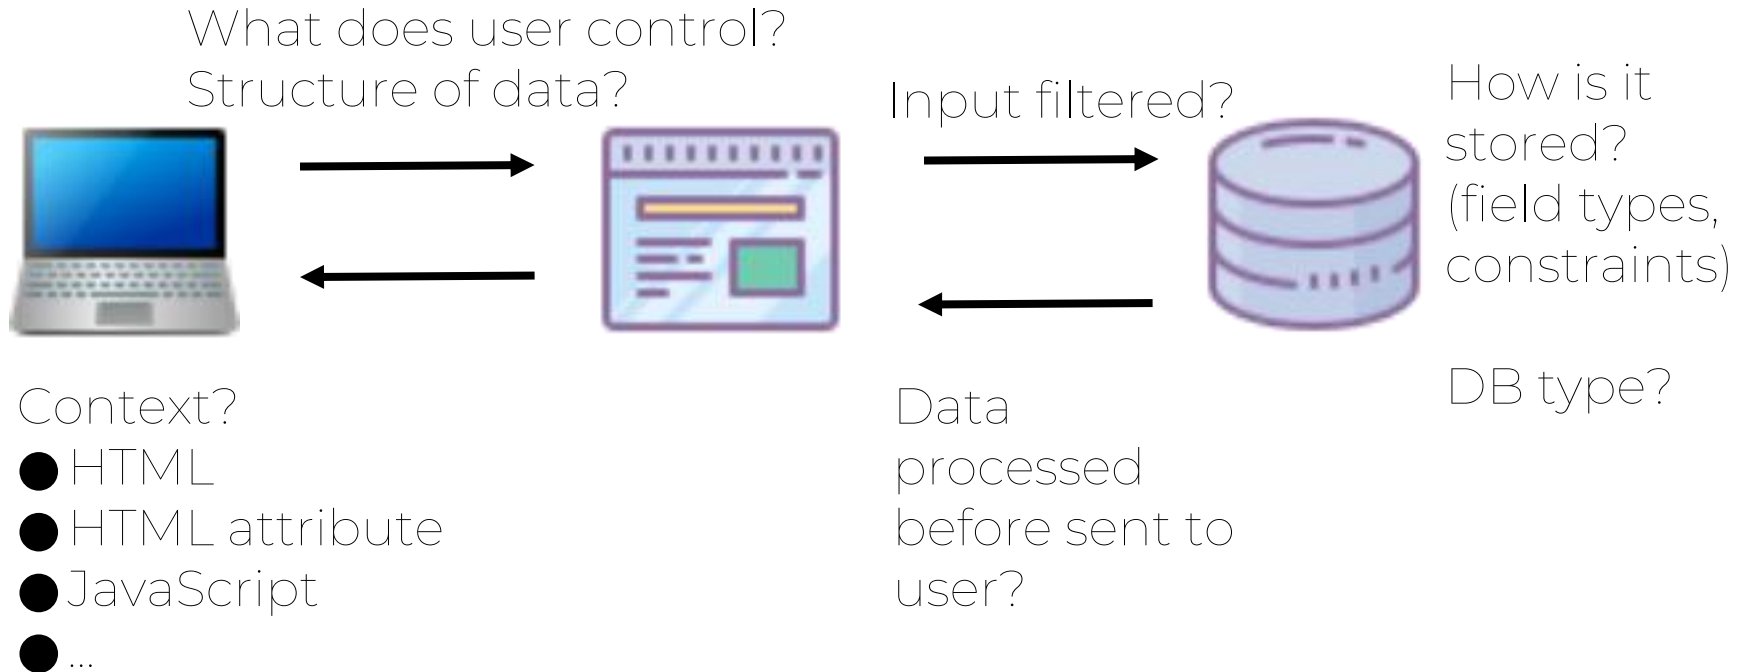

# Quiz: Does this app have XSS?

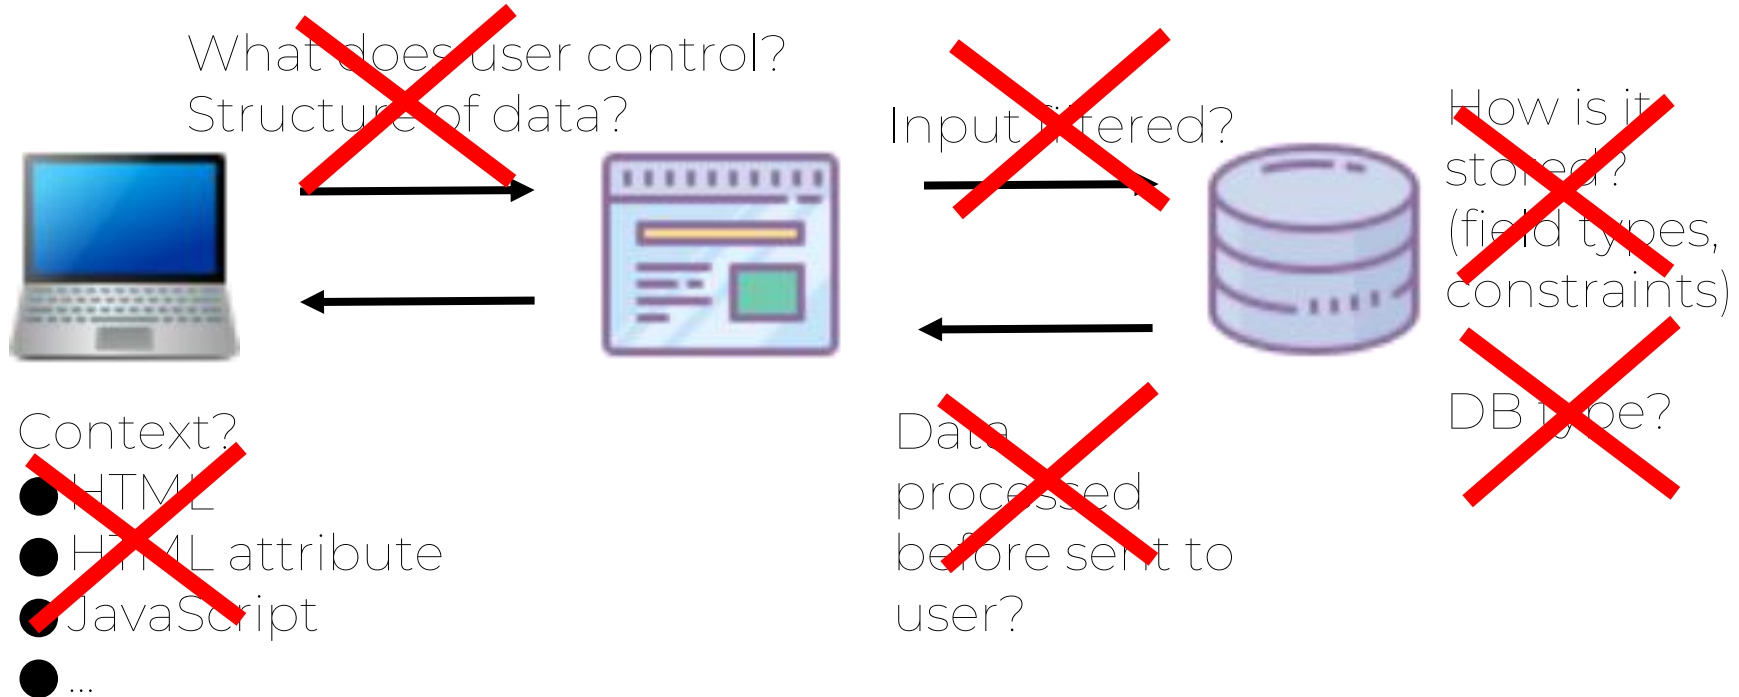

# Quiz: Does this app have XSS?

**Invariant: Frontend is *React*, banned *dangerouslySetInnerHTML***

# Quiz: Does this app have XSS?

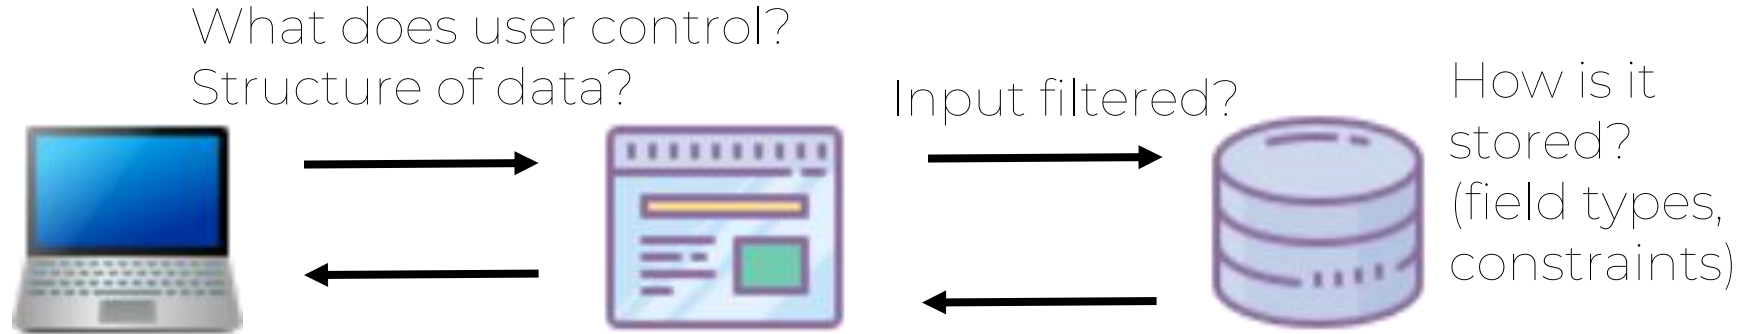

**Invariant: Frontend is *React*, banned *dangerouslySetInnerHTML***

Quiz: Does this app have RCE?

# Quiz: Does this app have RCE?

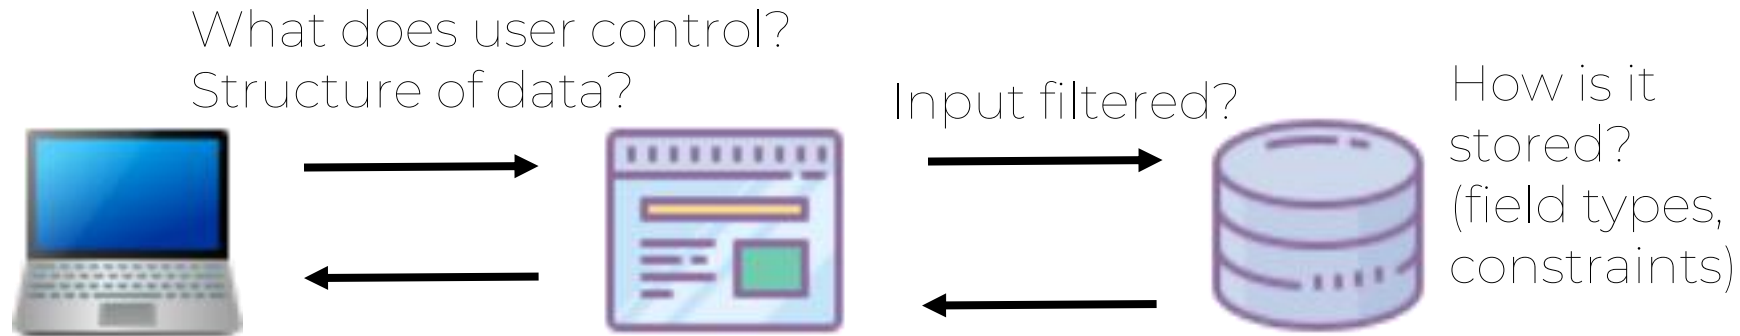

Does the app?

- Deserialize data
- Run shell commands
- Mix data and code
  - `eval()`, `exec()`
  - Metaprogramming

# Quiz: Does this app have RCE?

**Ban:** *exec()*, *eval()*, *shell exec*, *deserialization* (*objects*, *YAML*, *XML*, *JSON*)

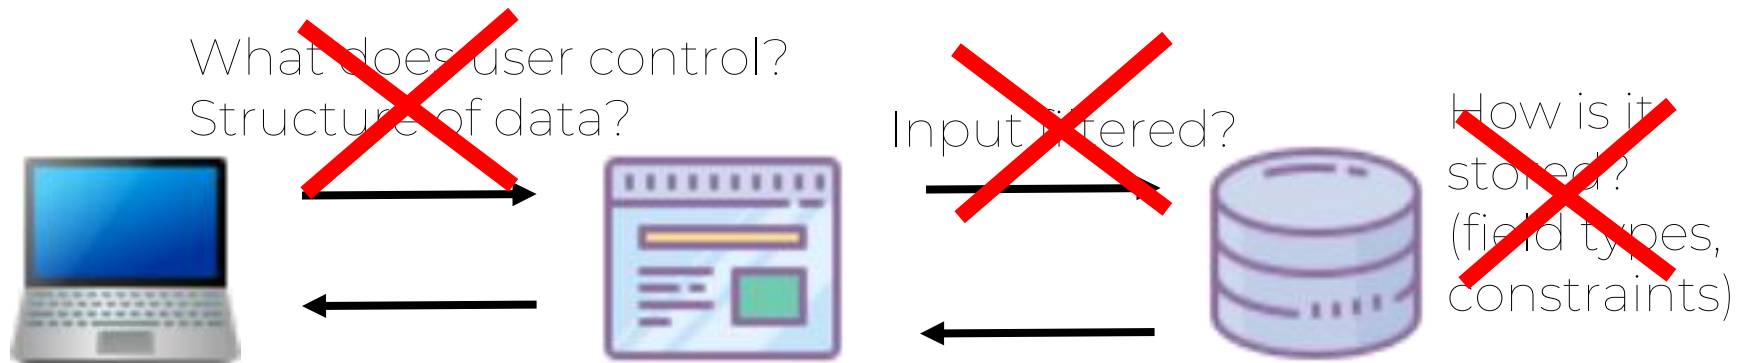

Does the app?

- Deserialize data
- Run shell commands
- Mix data and code
- *eval()*, *exec()*
- Metaprogramming

# Quiz: Does this app have RCE?

**Ban:** *exec()*, *eval()*, *shell exec*, *deserialization* (*objects*, *YAML*, *XML*, *JSON*)

Does the app?

- Deserialized data
- Run shell commands
- Mix data and code
- *eval()*, *exec()*
- Metaprogramming

# Task vs Effort Required

Detecting (lack of) use of  
secure defaults

is much easier than

finding bugs

# #Broke

Finding every vulnerability

# #Woke

Preventing *classes* of vulnerabilities

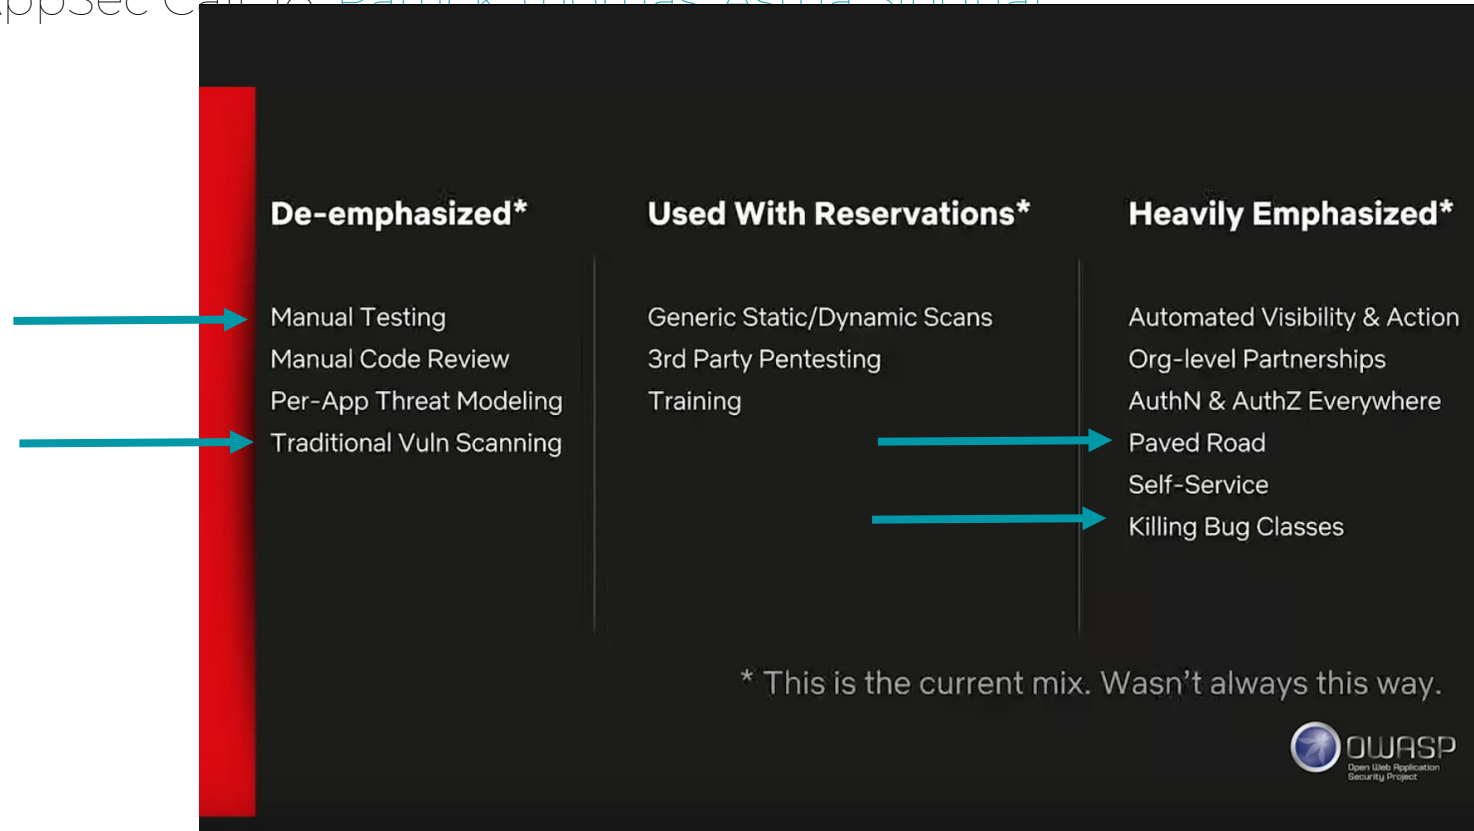

# Your Internal Dialogue?

- “All you’ve shown me is some hand-wavy diagrams”
- The security industry has focused on bug finding for decades
  - SAST, DAST, pen tests, bug bounty

# We Come Bearing Gifts: Enabling Prod Security w/ Culture & Cloud

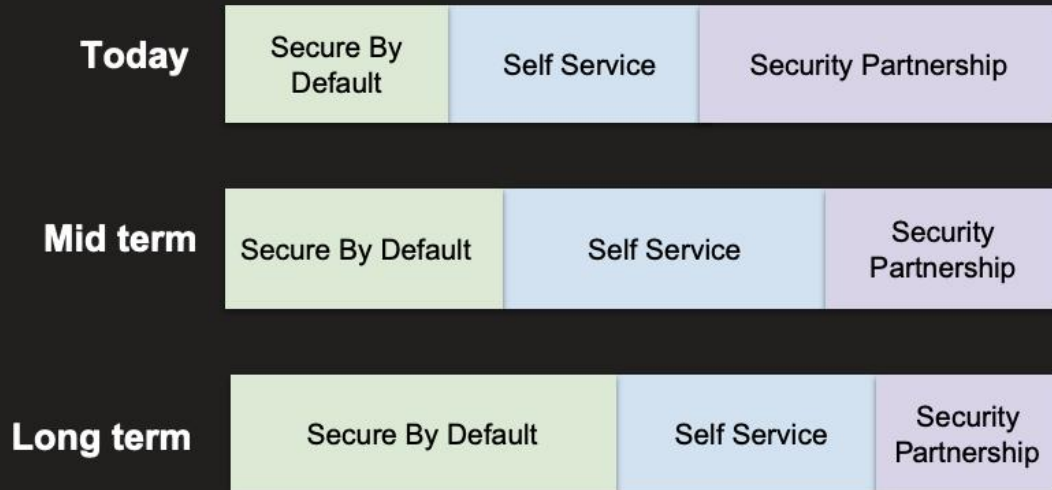

AppSec Cali '18 Patrick Thomas Astha Singhal

# A Pragmatic Approach for Internal Security Partnerships

AppSec Cali '19 Scott Roberson Esha Kanekar

## How is the future shaping up for us?

# How Valuable Can Banning Functions Be?

41% of vulnerability reduction from XP → Vista from *banning strcpy* and friends

*"Security Improvements in Windows Vista", Michael Howard*

- ## Safe Libraries Developed

- 120+ Banned functions
- IntSafe (C safe integer arithmetic library)
- SafeInt (C++ safe integer arithmetic template class)
- Secure CRT (C runtime replacements for strcpy, strncpy etc)
- StrSafe (C runtime replacements for strcpy, strncpy etc)

[illegible]

Analysis of 63 buffer-related security bugs that affect Windows XP, Windows Server 2003 or Windows 2000 but not Windows Vista: 82% removed through SDL process

- 27 (43%) found through use of SAL (Annotations)
- 26 (41%) removed through banned API removal

# Tools and Training Help, but are Not Enough

## We need a safer systems programming language

Security Research & Defense / By MSRC Team / July 18, 2019 / Memory Safety, Rust, Safe Systems Programming Languages, Secure Development

From the Microsoft Security Response Center [blog](#):

- “Tools and guidance are demonstrably not preventing this class of vulnerabilities; memory safety issues have represented almost the same proportion of vulnerabilities assigned a CVE for over a decade.”

# Google:

- “It’s unreasonable to expect any developer to be an expert in all these subjects, or to constantly maintain vigilance when writing or reviewing code.
- A better approach is to handle security and reliability in **common frameworks, languages, and libraries**. Ideally, libraries only expose an interface that makes writing code with **common classes of security**

[Building Secure and Reliable Systems](#), by Google

# Facebook:

"We invest heavily in building frameworks that help engineers prevent and remove entire classes of bugs when writing code."

[Designing Security For Billions](#) by Facebook

## Defense in Depth

Keeping Facebook safe requires a multi-layered approach to security

### Secure frameworks

Security experts write libraries of code and new programming languages to prevent or remove entire classes of bugs

### Automated testing tools

Analysis tools scan new and existing code for potential issues

### Peer & design reviews

Human reviewers inspect code changes and provide feedback to engineers

### Red team exercises

Internal security experts stage attacks to surface any points of vulnerability

# “But I’m not Google”

Framework / tech choices **matter**

- Mitigate classes of vulnerabilities

Examples:

- Using modern web frameworks
- [DOMPurify](#) - output encoding
- [re2](#) - regexes
- [tink](#) - crypto

*Web security before  
modern frameworks*

## 2. How to Eradicate Vulnerability Classes

# Compounding Effects of Killing Bug Classes

# How to Eradicate Vulnerability Classes

1. Select a vulnerability class
2. Find/prevent it at scale
3. Select a safe pattern and make it the default
4. Train developers to use the safe pattern
5. Use tools to enforce the safe pattern

# 1. Select a vulnerability class

## Common selection criteria

Bug classes that are:

1. The most prevalent
2. The highest impact / risk
3. Easiest to tackle (organizationally, technically)
4. Organizational priorities
5. Weighted: `f (prevalent, severe, feasible, org)`

# 1. Select a vulnerability class

Vulnerability Management [more](#)

Know your **current state** and if your future efforts **actually work**

# 1. Select a vulnerability class

## Vulnerability Management (more)

Know your **current state** and if your future efforts **actually work**

Track:

- Risk, Severity, Impact
- Vuln class - access controls, XSS, SQLi, open redirect, ...
  - Create a taxonomy (e.g. OWASP Top 10, [Bugcrowd's VRT](#))
  - Aim for 20-40 categories (should have different root cause/fix)
- PR introducing / fixing the issue
- Relevant code base (and team/org)
- Root cause
- What source found this? (DAST, SAST, pen test, bug bounty, ...)
- Mitigating factors

# 1. Select a vulnerability class

## Building the List of Prior Vulnerabilities to Review

When your vuln tracking has been inconsistent

### Common Sources

- JIRA/GitHub issues tagged “security”
- Create a list of security-relevant keywords
  - Search pull/merge requests, issue tracker, git commit history
  - `git log --grep "xss"`
- Security tool reports (SAST, DAST, ...)
- Pen test reports, bug bounty submissions
- Ask development, ops, and security teams for examples

# 1. Select a vulnerability class

## Building the List of Prior Vulnerabilities to Review

When your vuln tracking has been inconsistent

### Common Sources

- JIRA/GitHub issues tagged “security”
- Create a list of security-relevant keywords
  - Search pull/merge requests, issue tracker, git commit
  - `git log --grep "xss"`
- Security tool reports (SAST, DAST, ...)
- Pen test reports, bug bounty submissions
- Ask development, ops, and security teams
- Use Google! Use framework documentation!

### Going Forward

Fully analyzing ad hoc historical data may not be worth the time

**Now:** create and document a *lightweight*, standardized process

- Make your life easier next time

# 1. Select a vulnerability class

## Slice and Dice

- Group by vulnerability class
- Group by source (DAST, SAST, BB...)
- Weight by severity/risk/impact

Data Driven Bug Bounty by [@arkadiyt](#)

# 1. Select a vulnerability class

## Slice and Dice

- Group by vulnerability class
- Group by source (DAST, SAST, BB...)
- Weight by severity/risk/impact

## Choose a bug class and review the fixes

- What did the vulnerable code look like?
- What did the fix look like?

What **trends** do you see?

- **Good**: vulnerable code looks similar
- **Bad**: all buggy code looks different

## Data Driven Bug Bounty by @arkadiyt

# 1. Select a vulnerability class

## Ideal World

Choose a vulnerability class that is:

- Widespread across teams/repos
- High Risk
- Feasible to get devs to fix
- Aligns with company priorities
- Always broken in the same way

1. Select a vulnerability class

Pick one and eliminate it!

## 2. Find/prevent at Scale

### Problem

Big picture, architectural flaws →

Cloud misconfigurations →

Complex business logic bugs →

Protect vulns until they're patched →

Known good/known bad code

### Security Approach

Threat Modeling

IaaS scanning, Cartography, BB

Pen tests, bug bounty

WAF, RASP

Lightweight static analysis

### 3. Select a Safe Pattern and Make it the Default

- Based on internal coding guidelines, standards, your expertise, ...

Life is too short • AppSec is tough • Cheat!

Application Security Verification Standard 4.0

Final

### 3. Select a Safe Pattern and Make it the Default

#### Update all internal coding guidelines (security & dev)

- READMEs, developer documentation, wiki pages, FAQs
  - Training slides, onboarding presentations, ...
- Explain *why* these patterns exist and *how* to use them

#### Work with developer productivity team

- **Secure** version should have an **even better dev UX** than the old way
  - Potentially: build a **secure library**. Make the insecure pattern hard to use while still letting devs go fast
  - How can we increase dev productivity *and* security?
- Integrate security at the **right points** (e.g. new project starter templates) to get automatic, widespread adoption
- “**Hitch your security wagon to dev productivity.**” - [Astha Singhal](#)

## 4. Train Developers to Use the Safe Pattern

### Making Communications Successful

- What and why something is insecure should be clear
  - Use terms developers understand, no security jargon
- Convey impact in terms devs care about
  - Risk to the business, damaging user trust, reliability, up time
- How to fix it should be *concise* and *clear*
  - Link to additional docs and resources with more info
  - Have a dedicated #AppSec chat channel for further questions

# Don't Run with Scissors: How to standardize how developers use dangerous aspects of your framework by

Morgan Roman

## How to write training/documentation

If you use <THE BAD WAY>, <BAD THING WILL HAPPEN>. Instead use the <THE GOOD WAY> since <IT STOPS THE BAD THING>.

### DO NOT DO THIS:

<EXAMPLE OF THE BAD WAY>

### DO THIS INSTEAD:

<EXAMPLE OF THE GOOD WAY>

Explain it simply and clearly.  
You do not need to use security lingo  
like XXE/ReDoS/XSS/RCE etc.

First show an example on how the developer  
intends to do it if you have one  
Then show how they can do it correctly.  
Make sure it is simple to do.

## 4. Train Developers to Use the Safe Pattern

### How to Engage: Some Options

- During developer onboarding
- Lead educational brown bag sessions over lunch
- Internal CTFs
- Security champions
- When in-person interaction is feasible again
  - Grab lunch with dev teams and/or schedule a happy hour
  - Have candy on desks by the security team

## 5. Use Tools to Enforce the Safe Pattern

Use **lightweight static analysis** (grep, linting) to ensure the **safe patterns are used**

### 3. Tools & Techniques To Make It Real

# How to Eradicate Vulnerability Classes

1. Evaluate which vulnerability class to focus on
2. Determine the best approach to find/prevent it at scale

→ How to set up continuous code scanning

1. Select a safe pattern and make it the default
2. Train developers to use the safe pattern
3. Use tools to enforce the safe pattern

→ Checking for escape hatches in secure

# Continuous Scanning: Best Practices

## Scan Pull Requests

every commit is too noisy, e.g. WIP commits

## Scan Fast (<5min)

feedback while context is fresh

can do longer / more in depth scans daily or weekly

## Two Scanning Workflows

**audit** (sec team, visibility), **blocking** (devs, pls fix)

## Make Adjustment Easy

Make it cheap to add/remove tools and new rules

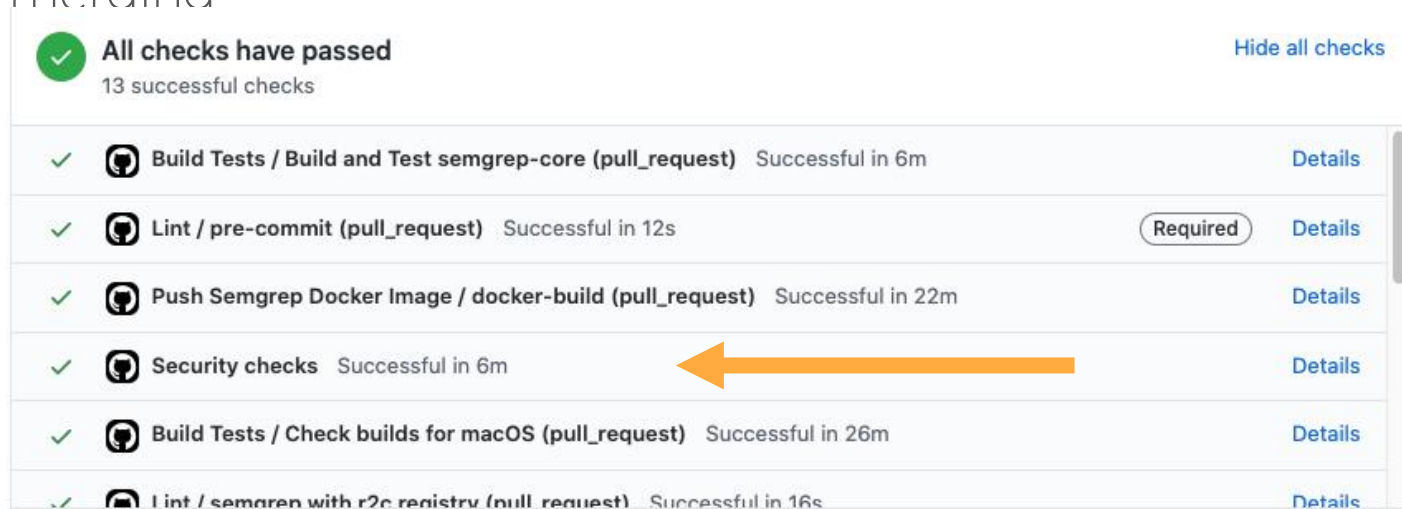

✓	<b>All checks have passed</b>	13 successful checks
✓	 <b>Security Scan</b>	Successful in 33 days
✓	 <b>Lint / pre-commit (pull_request)</b>	Successful in 12s

# Scan Fast

Don't come in last!

Security checks should not be the slowest check blocking developer from merging

The screenshot displays a GitHub Actions workflow summary. At the top, a green checkmark indicates 'All checks have passed' with '13 successful checks'. Below this is a list of individual checks, each with a green checkmark, a GitHub Actions icon, a description, a status, and a 'Details' link. An orange arrow points to the 'Security checks' row, which is the fastest at 6m. The 'Lint / pre-commit' row is marked as 'Required'.

Check Name	Status	Duration	Details
Build Tests / Build and Test semgrep-core (pull_request)	Successful	6m	Details
Lint / pre-commit (pull_request)	Successful	12s	Details
Push Semgrep Docker Image / docker-build (pull_request)	Successful	22m	Details
Security checks	Successful	6m	Details
Build Tests / Check builds for macOS (pull_request)	Successful	26m	Details
Lint / semgrep with r2c registry (pull_request)	Successful	16s	Details

# Scan Early

Tell me as soon as possible, ideally in the editor.

Also enforce in CI so that it can't be ignored.

```
25 from semgrep.semgrep_types import pattern_names_for_operator
26 from semgrep.semgrep_types import PatternId
27 from semgrep.semgrep_types import Range

48     )
49     for pm in pattern_matches:
```

# Autofix

Make security fixes fast and easy.

Even an imperfect suggestion is better than nothing!

SEMGREP RULE

Simple

Advanced

code is

TODO

Suggest +

and autofix is

TODO

Suggest

TEST CODE

```
1 import sys
2
3 def check_db(user):
4     if user is None:
5         exit(4)
6     else:
```

Run ↵

MATCHES

No Matches

Try tweaking your pattern or code or open a bug if you feel there should be a match. If you are composing multiple patterns, try enabling step-by-step debugging under "Advanced Options" next to the Run button.

The [config documentation](#) has more details on the syntax and boolean logic. Here are some common issues:

Try: <https://semgrep.dev/ievan:tlsautofix>

# Continuous Scanning: Best Practices

Show tool findings **within dev systems**  
(e.g. on PR as a comment)

**Clear, actionable**, with link  
to more info

```
return getString() == "foo".toString();
```

▼ **ErrorProne** String comparison using reference equality instead of value equality  
(see <http://code.google.com/p/error-prone/wiki/StringEquality>)  
StringEquality  
1:03 AM, Aug 21

[Please fix](#)

Suggested fix attached: [show](#)

[Not useful](#)

```
}  
  
public String getString() {  
    return new String("foo");  
}
```

(Screenshot from [Google's, Tricorder: Building a Program Analysis Ecosystem](#))

Capture **metrics** about check types,  
scan runtime, and false positive rates

Track & evict **low signal** checks:  
keep only +95% true positives

Otherwise causes ill will with devs + too much security team  
operational cost

# Continuously Finding: Escape Hatches

If we use secure frameworks that maintain invariants, all we need to do is detect the functions that let you "escape" from those invariants. For instance:

- `dangerouslySetInnerHTML`
- `exec`
- `rawSQL(...)`
- `myorg.make_superuser`

# How to find them?

- Grep

- Pro: easy to use, interactive, fast
- Con: line-oriented, mismatch with program structure ([ASTs](#))

- Code-Aware Linter

- Pro: robust, precise (handles whitespace, comments, ...)
- Con: Each parser represents [ASTs](#) differently; have to learn each syntax

# What we do

## Semgrep

Get Started

★ 3.3k 📦 v0.42.0 (14 hours ago)

Static analysis at ludicrous speed  
Find bugs and enforce code standards

Open source, works on 17+ languages  
Not proprietary and not only for legacy languages

Scan with 1,000+ community rules  
Not vendor controlled

Write rules that look like your code  
No painful and complex DSL

Quickly get results in the terminal, editor, or CI/CD  
Don't wait hours or days for results

Flag issues moving forward, get results in pull requests, Slack, + more  
Don't be forced to fix all existing issues just to get started

RULE [Open in Playground](#)

```
print(...)
```

TEST CODE (Python)

```
1 def hello_world(abc):
2     logger.info('starting skynet')
3     skynet.init()
4     # TODO Change this to logging framework before prod
5     print(f'--> debug, skynet init vector is {skynet.iv}')
6     return skynet.rule_forever()
7
8
9
10
```

Hello World (Python) [▶](#)

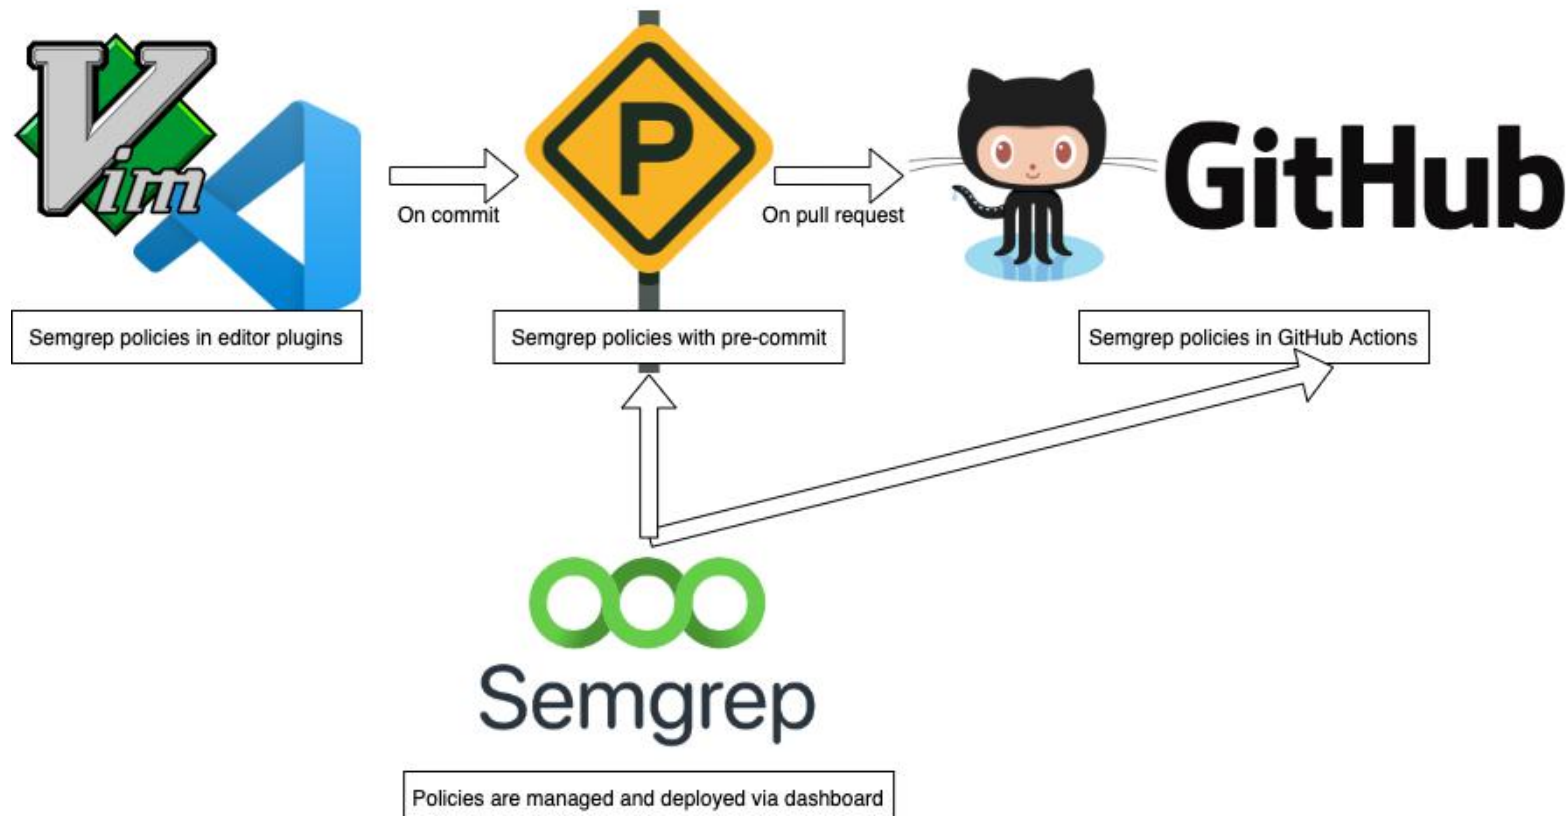

### Language support

Go Java JavaScript JSON Python Ruby TypeScript JSX  
TSX Generic (YAML, ERB, Jinja, etc) [+ More languages](#)

# 1. Select a vulnerability class

- r2c is young
  - Two (2) primary codebases
  - Limited vulnerability history
- Prioritize based on common problems for the **type** of application:
  - Web application → XSS
  - Command line interface → Code and Command injection

## 2. Prevent it at scale

### 3. Select a safe pattern and make it the default

[typescript.react.security.audit](#)

[Run Locally](#) [Add to Policy](#) ▼

react-dangerouslysetinnerhtml

[Example 1](#) [Example 2](#)

Example

```
•   return <div dangerouslySetInnerHTML={createMarkup()} />;
    }

    function TestComponent2() {
      // ruleid:react-dangerouslysetinnerhtml
    •   return <li className={"foobar"} dangerouslySetInnerHTML={createMarkup()} />;
      }

    function TestComponent3() {
      // ruleid:react-dangerouslysetinnerhtml
```

Setting HTML from code is risky because it's easy to inadvertently expose your users to a cross-site scripting (XSS) attack.

## Mitigations

Item	Name	Semgrep rule	Recommendation
1.A.	Ban <code>render_template_string()</code>	python.flask.security.audit.render-template-string.render-template-string	Use <code>render_template()</code> .
1.B.	Ban unescaped extensions	python.flask.security.unescaped-template-extension.unescaped-template-extension	Only use <code>.html</code> extensions for templates. If no escaping is needed, review each case and exempt with <code># nosem</code> .
1.C.	Ban <code>Markup()</code>	python.flask.security.xss.audit.explicit-unescape-with-markup.explicit-unescape-with-markup	If needed, review each usage and exempt with <code># nosem</code> .
2.A.	Ban returning values directly from routes	python.flask.security.audit.directly-returned-format-string.directly-returned-format-string	Use <code>render_template()</code> or <code>jsonify()</code> .
2.B.	Ban using Jinja2 directly	python.flask.security.xss.audit.direct-use-of-jinja2.direct-use-of-jinja2	Use <code>render_template()</code> .
3.A.	Ban <code>  safe</code>	python.flask.security.xss.audit.template-unescaped-with-safe.template-unescaped-with-safe	Use <code>Markup()</code> in Python code if necessary.
3.B.	Ban <code>{% autoescape false %}</code>	python.flask.security.xss.audit.template-autoescape-off.template-autoescape-off	Use <code>Markup()</code> in Python code if necessary.
4.A.	Flag unquoted HTML attributes with Jinja expressions	python.flask.security.xss.audit.template-unquoted-attribute-var.template-unquoted-attribute-var	Always use quotes around HTML attributes.
4.B.	Flag template variables in <code>href</code> attributes	python.flask.security.xss.audit.template-href-var.template-href-var	Use <code>url_for</code> to generate links.
4.C.	Ban template variables in <code>&lt;script&gt;</code> blocks.	N/A	Use the <code>tojson</code> filter inside a data attribute and <code>JSON.parse()</code> in JavaScript.

# Conclusion

- Secure defaults are the best way to scalably raise your security bar
  - Not finding bugs (bug whack-a-mole)
- Killing bug classes makes your AppSec team more leveraged
- Define safe pattern → educate / roll out → enforce continuously
  - Fast & lightweight (e.g. [semgrep](#)), focus on dev UX
