And if this does not work.  
Go back to **Principle 1**

- ✓ Agree on the processes which will be followed during development
- ✓ Educate the team on best coding practices, tools, frameworks & processes
- ✓ Cultivate a growth mindset
- ✓ Create a software security initiative (SSI)
- ✓ Think of ways to promote security:
  - Security Champions
  - Bug Bounty Programs
  - Capture the Flag
  - Security Games

The Cryptography Bill of Materials

The Cryptography Bill of Materials (CBOM) is an object model that describes cryptographic assets and their dependencies, aiming to simplify the management of cryptography inventory and accelerate the migration to quantum-safe solutions. CycloneDX version 1.6, which incorporates the Cryptographic Bill of Materials (CBOM) capability, has recently achieved international recognition by being adopted as an ECMA standard. This development underscores the growing importance and acceptance of CycloneDX in the software supply chain security landscape. Overall, CBOM significantly enhances visibility into the cryptographic aspects of the software supply chain, enabling organizations to better manage risks, ensure compliance, and prepare for future cryptographic challenges, including the transition to quantum-safe cryptography.
